A Most Trusted Industrial Painting & Powder Coating Powder Dealer in Chennai

Paramount Powders Pvt. Ltd. is a renowned name in quality Powder Coating and have achieved significant market share in last decade.

The study growth made possible with technological back up of Paramount Powders (UK) Limited, in house well equipped R&D centre and exclusive technical team. The latest input on scientific developments in Powder Coatings from UK unit has spurred the Indian counterpart to assert itself with excellent quality and services.

Thermosetting powder coating brand 'Para Coat' from Paramount Powders Pvt. Ltd. is available in matt, satin, gloss, hi-gloss and various surface finishes like texture, structure, wrinkle, metallic, hammer tone, antique e.t.c in more than 1000 shades based on RAL, Pantone, IS, BIS e.t.c. along with customize shades in following chemistries:

- Epoxy Powder Coatings
- Epoxy Polyester Powder Coatings
- Polyester Powder Coatings
- TGIC Free Polyester Coatings
- Polyurethane Powder Coatings

Paramount Powders Pvt. Ltd. has specialized in following Powder Coating:

- > Super Durable (Non – Metallic)
- > Special Texture/ Structure/Wrinkle Patterns
- > Two tone effect/ Sparkle / Marble finish
- > Bonded Metallic
- > Polyester Dead Matt
- > Super Jet Black
- > High Impact (up to 300 kgs-cm)
- > Excellent Nail Resistant Metallic
- > Anti-Microbial
- > Low Cure and Fast Cure
- > Water like clears

You can count on us for quality, consistency and technical support. We can deliver 200 kgs to 10MT batch with customisation in shortest span.

Paramount Powders can offer following systems of powder
Epoxy, Epoxy Polyester, Polyester and Polyurethane

Pre-treatment:

Epoxy, Epoxy Polyester, Polyester and Polyurethane powders adhere to most metals and do not require any primer. Articles to be coated must be free from rust, grease, oil and mill scale. In order to improve corrosion resistance the use of iron/zinc or tricationic phosphate is strongly recommended. Aluminium should be pre-treated using a chromate conversion system prior to powder coating. To achieve good adhesion on stainless steel substrate, a strong acid etch or the use of iron phosphate containing fluoride is recommended. Zinc based die-casting and Zintec should also be pre-treated.

Application Guidelines:

Epoxy, Epoxy Polyester, Polyester and Polyurethane powders are suitable for use with all electrostatic powder spraying equipment. Voltage between 40-100 kv may be applied. The powders are sprayed electro-statically onto earthed metallic substrate and an even layer of powder deposited. Thereafter, substrate with uniform layer of powder on it is subjected to specific curing temperature. The powder melts and flows to form a continuous cured film, resulting in a coating with mechanical and chemical properties. Typical coating thickness should be 40 – 100 microns depending upon powder system and finish.

Epoxy Powders form a hard and tough film with excellent chemical resistance. Surface chalking will develop on exterior exposure. Recommended for interior use and where high degree of surface hardness and resistance to solvents and chemicals required.

Epoxy Polyester Powders also known as **Hybrid Powders** provide a tough coating with excellent resistance to corrosion and mechanical damage. Slight surface chalking will develop after prolonged exterior exposure.

Polyester Powders also known as **Pure Polyester Powders** have excellent chemical resistance and mechanical properties. Polyester powders have been formulated to give hard, durable finishes with very good light and weather resistance on prolonged exterior exposure.

Polyurethane Powders have excellent flow characteristics with excellent chemical and mechanical properties. Their outstanding corrosion resistance and excellent external exposure properties make them suitable alternative to polyester powders.
